

David Cervantes

AI Product Designer · AI Workflows · Design-to-Code

Orlando, FL · uxokdc@gmail.com · (941) 993-9125 · linkedin.com/in/davidcervantes · uxokdc.com

SUMMARY

AI product designer with 25+ years across fintech, healthcare, retail, real estate, e-commerce, and emerging technology. I design AI-native products, the workflows behind them, and the working experiences that bring them to life.

My work spans research, product strategy, UX, conversational and agentic workflows, prototyping, integrations, and design-to-code. I focus on making AI useful and trustworthy by defining what it should understand, when it should act, what it should explain, and when it should hand control back to a person.

SELECTED AI PRODUCT WORK

TraderVault LM

AI Trading Platform · Fintech

Product Strategy · Research · UX · Brand · AI Workflows · Design-to-Code

TraderVault LM is an AI-native trading platform that helps traders build strategies, backtest them against historical market data, understand why they succeed or fail, and move into live execution. I shaped the experience around real trading behaviors, strategy logic, risk management, and decision patterns rather than a conventional trading dashboard.

The platform combines a visual strategy builder, intelligent backtesting, performance analysis, live execution, and copy trading. The AI interprets strategy and market results and explains the reasoning behind them instead of returning a black-box score.

Status: Discovery, product design, brand, and scope complete. MVP in development. Copy-trading proof of concept complete.

Stack: Next.js · TypeScript · React · Tailwind · Supabase (Postgres, Auth, Realtime) · Python (backtesting workers, indicator engine) · Claude via MCP · GPT-5 for reasoning passes · TradingView charts · WebSocket market-data feeds (Polygon, Alpaca) · DXtrade broker integration · Redis (backtest cache, live-tick buffer) · Twilio (SMS alerts on entries, exits, and risk thresholds) · Resend (daily performance emails) · Vercel · GitHub · Playwright (QA + regression on strategy runs) · Figma · Framer

Case Study: uxokdc.com/TraderVault-LM →

Momenta CRM

AI-Native Real Estate Advisor · United States

Product Strategy · Research · UX · Conversational Workflows · AI Experience Design

The home-buying process is fragmented across agents, lenders, inspectors, attorneys, and other specialists. Momenta was designed around one intelligent advisor that maintains the buyer's goals, priorities, questions, and decision history throughout the journey.

The experience begins by understanding intent before presenting inventory, then connects property discovery, valuation, education, decision support, and specialist handoffs. The AI maintains context across sessions and helps buyers evaluate properties without repeatedly starting over.

Status: Brand and research complete. MVP defined. Development in progress.

Stack: Next.js · TypeScript · React · Tailwind · shadcn/ui · Supabase (Postgres, magic-link auth, Realtime for advisor context sync) · Claude (conversational advisor, valuation reasoning) · MCP (specialist tool routing) · Google Maps + property data feeds · Twilio (buyer/agent SMS coordination) · Resend (buyer email digests) · Stripe (agent subscriptions) · Vercel · GitHub · Playwright · Figma

TintoProps

AI Property Discovery · Colombia

Product Strategy · Research · Brand · UX · AI Workflows

TintoProps helps international buyers understand a real-estate market primarily designed for local buyers. Colombian listings often assume familiarity with neighborhoods, terminology, pricing conventions, and market expectations, so direct translation alone is not enough.

I designed the product around how foreign buyers actually evaluate property. It combines bilingual discovery, dual-currency pricing, relevant search criteria, neighborhood context, and market interpretation. The AI explains listings, terminology, value, and neighborhood context from the buyer's perspective.

Status: Brand and research complete. MVP defined.

Stack: Next.js · TypeScript · React · Tailwind · Supabase (Postgres, bilingual schema, RLS by user locale) · Claude (listing rewrite, neighborhood context, valuation interpretation) · next-intl (Spanish/English) · Open Exchange Rates (COP/USD live conversion) · Google Maps (Colombia geodata) · Python + Playwright (listing ingestion from local portals) · BeautifulSoup (parsing) · Vercel · GitHub · Figma · Framer

Case Study: uxokdc.com/TintoProps →

Construct AI

Intelligent Construction Operations

Product Strategy · Research · Brand · UX · Reactive AI Workflows

Construction projects lose margin through small operational misses that compound over time, including material shortages, overlooked insurance supplements, difficult estimates, and budget drift.

I designed Construct AI as a proactive operations layer that monitors project information, interprets estimates and line items, identifies risks and opportunities, and surfaces actions that may need attention. The AI helps catch shortages, budget variance, supplement opportunities, and other issues before they become larger problems.

Status: Brand and research complete. MVP defined. Development planned.

Stack: Next.js · TypeScript · React · Tailwind · Supabase (Postgres, project + estimate schema) · Python (PDF + carrier-estimate parser via pypdf, unstructured, pandas) · Claude (line-item interpretation, variance reasoning) · GPT-5 (multi-model routing for numeric checks) · Xactimate estimate ingestion · Twilio (site-manager SMS alerts) · Resend (daily variance email) · Vercel · GitHub · Playwright (QA) · Figma

HOW I WORK

I combine product strategy, research, design, prototyping, workflow architecture, and implementation in one continuous process. I move from product intent into AI behavior, interaction design, working flows, integrations, and functioning software rather than treating design as a handoff.

I use AI-assisted development and multi-model workflows to explore, test, refine, build, and validate ideas faster. I can own the full product loop or work within an existing product and engineering organization where senior product thinking, AI workflow design, rapid prototyping, or design-to-code capability is needed.

AI PRODUCT METHODS

Intent-Centered Design

Start with the decision the person is trying to make, not the screen they are using. The user's intent becomes the foundation for what information the product presents, what intelligence the system provides, and how the experience responds.

Reactive AI

Design systems that respond to context instead of waiting for the next prompt. Reactive AI recognizes conditions, anticipates likely next actions, surfaces relevant information proactively, and adapts based on user response.

Conversational Flow Mapping

Treat conversation as an interaction model. Map intent, context, clarification, system response, uncertainty, escalation, and human handoff with the same discipline used to design a visual interface.

AI WORKFLOWS

I design the workflows that sit behind AI experiences, not just the interface around them. That includes defining triggers, context, memory, model behavior, agent responsibilities, system actions, escalation rules, human approval points, and what happens when the AI is uncertain or fails.

My work includes conversational workflows, agentic workflows, proactive monitoring, automated research and operations, browser automation, multi-model routing, and design-to-code development systems. The goal is to make the AI behavior as intentional as the UX itself.

AI IN MY PRACTICE

AI is both something I design into products and something I use to build them. I use it for research synthesis, product exploration, conversational prototyping, brand and copy work, development, QA, browser automation, and repeatable product workflows.

I also use a Claude-centered multi-model development process to move directly from product design into functioning software. The objective is a tighter loop between understanding the problem, designing the right experience, building it, and validating that it works.

SELECTED PRODUCT WORK

Ulta Beauty — Self-Service Retail Media Platform. Designed a self-service B2B advertising platform that allows brand partners to launch, manage, and optimize campaigns using Ulta's first-party customer data. The experience included audience targeting, campaign management, analytics, attribution, and optimization.

NESTRE — Cognitive Training Platform. Helped translate a neuroscience and cognitive-performance methodology into an adaptive digital product with cognitive-training workflows, progress tracking, and dashboards for individuals and organizations.

ULTRA — Blockchain-Based Social Platform. Designed an on-chain social experience on Ethereum while hiding the complexity of cryptocurrency from mainstream users. Wallet creation happened in the background during onboarding, marketplace values were presented in dollars, and blockchain calculations stayed invisible.

to the user. The goal was to give people the benefits of blockchain infrastructure without requiring them to understand wallets, keys, tokens, or crypto pricing.

Yelo — Campus Ride-Hailing Platform. Designed a ride-hailing experience built around individual campus communities rather than a broad citywide marketplace. The product model was shaped around the scale, behaviors, needs, and trust dynamics of each campus.

EXPERIENCE

Independent AI & Product Design Practice · 2023–Present

Lead AI-native product strategy, experience design, workflow architecture, prototyping, and development across fintech, real estate, construction, travel, blockchain, and emerging product categories.

- Designed and developed AI products from problem definition through working prototype and implementation.
- Built TraderVault LM, Momenta CRM, TintoProps, and Construct AI across multiple industries and AI use cases.
- Combined user research, product strategy, interaction design, AI workflow design, prototyping, and working-code delivery in one process.
- Designed conversational and agentic workflows including triggers, memory, context, model behavior, automation, escalation, and human handoff.
- Developed Intent-Centered Design, Reactive AI, and Conversational Flow Mapping as repeatable approaches for AI-native experiences.
- Designed agent workflows, browser automation, scheduled jobs, research systems, and autonomous development processes for studio operations.
- Built AI-assisted workflows connecting design, development, testing, review, and deployment.
- Created product architectures around persistent context, proactive intelligence, conversational interfaces, and human escalation.

Technology: TypeScript · Next.js · React · Tailwind · Python · Supabase · Postgres · Vercel · GitHub · Claude · MCP · GPT-5 · Playwright · Figma · Framer · Fal.ai · Twilio · Resend · Stripe · Redis · Google Maps · Polygon · Alpaca · DXtrade · TradingView · pypdf · pandas · unstructured · next-intl · shadcn/ui

VP, Technology & User Experience · Bang Energy · 2021–2023

Led digital experience, technology strategy, and business transformation across product, web, creative, and marketing.

- Defined the vision and roadmap for digital modernization.
- Led adoption of new technology and operating practices across product, design, creative, and development teams.
- Established standards for product delivery, UX, analytics, user testing, agile execution, site performance, and conversion optimization.
- Built and directed distributed teams of designers, writers, developers, and creative professionals.
- Aligned marketing, design, and technology priorities with broader business goals.
- Partnered with cross-functional stakeholders to translate business needs into product and experience strategies.
- Led early strategy and exploration in Web3, blockchain, AI, and creative automation.
- Established KPIs and performance measures for digital initiatives and optimization efforts.
- Mentored team members and created stronger standards for quality, execution, and professional growth.

UX Director / Practice Lead · Peak Activity · 2017–2021

Led the UX practice across client engagements from business and product strategy through research, interaction design, prototyping, and delivery.

- Directed the execution and quality of work produced by a cross-functional team of mid-to-senior UX designers.
- Led discovery, experience strategy, information architecture, interaction design, prototyping, and usability efforts.
- Partnered with strategy, content, analytics, design, and development teams to define product and experience roadmaps.
- Conducted competitive analysis, experience audits, heuristic reviews, and industry research.
- Built a reusable mobile-first design system used across client work.
- Introduced Axure prototyping, structured experimentation, and A/B testing into the practice.
- Led prototype development from early concepts through high-fidelity interactive experiences.
- Mentored UX team members and established stronger standards for craft, product thinking, and client communication.
- Guided product teams and stakeholders through design-thinking and decision-making processes.

Senior UX Architect · Office Depot · 2015–2017

Led major mobile and B2B experience initiatives across Office Depot's digital ecosystem.

- Designed the mobile application and mobile web experience from research and architecture through interaction design, UI, and post-launch optimization.
- Led the redesign of the B2B customer portal supporting contract pricing, account administration, purchasing, and repeat ordering.
- Simplified complex business rules and data-heavy workflows into usable digital experiences.
- Developed information architecture and interaction models for multi-account and enterprise purchasing experiences.
- Created a reusable style guide based on atomic-design principles that became a foundation for the company's design system.
- Wrote user stories and collaborated directly with agile product and development teams throughout implementation.
- Applied WCAG accessibility standards across mobile and web experiences.
- Conducted A/B and multivariate testing to improve conversion and usability.
- Advocated for UX practices across agile teams, product leadership, and business stakeholders.

Director of User Experience · AIM Consulting · 2013–2016

Led UX strategy and delivery for web and mobile applications across multiple industries and client organizations.

- Directed comparative research, information architecture, interaction design, service design, and rapid prototyping.
- Took projects from early discovery through implementation and QA.
- Built high-fidelity interactive prototypes in Axure.
- Created coded prototypes and wireframes using HTML, SCSS, and JavaScript.
- Worked directly with customers, product owners, business stakeholders, designers, and developers.
- Translated complex business requirements into clear digital workflows and experiences.
- Supported implementation teams throughout development to protect design intent and product quality.

Selected Client Work: Novation (hospital procurement and analytics workflows). Verizon (remote biometric-monitoring experiences). Travelocity (multi-device travel search and booking).

Consultant UX Strategist & Digital Producer · 1990s–2012

Worked across digital strategy, user experience, interactive production, advertising, and emerging digital channels for national brands including Nissan, Pepsi, and Levi's.

- Led information architecture, interaction design, prototyping, digital production, and analytics initiatives.
- Designed experiences across print, web, mobile, and integrated digital campaigns.
- Managed projects from concept and creative development through production and launch.
- Coordinated designers, writers, developers, producers, and external partners.
- Helped organizations adapt established brands and business models to new digital channels and technologies.

CORE CAPABILITIES

AI Product Design AI-native UX · Human-AI interaction · Conversational interfaces · Reactive systems · AI trust and explainability · Context and memory design · Human escalation

AI Workflows Agentic workflows · Workflow architecture · Multi-agent systems · Triggers and automation · Model routing · Context and memory · Human-in-the-loop systems · Browser automation · Proactive AI

Product & Experience Strategy Product discovery · User research · Product definition · Experience strategy · Journey mapping · Service design · Information architecture · Interaction design

Design & Prototyping Figma · Framer · Axure · Sketch · Adobe XD · Design systems · Responsive design · Rapid prototyping · Design-to-code · Accessibility (WCAG 2.1 AA)

Development & AI Tooling TypeScript · Next.js · React · Tailwind · shadcn/ui · Python · Supabase · Postgres · Redis · Vercel · GitHub · Claude · MCP · GPT-5 · Playwright · Fal.ai · n8n · LangGraph · CrewAI · Twilio · Resend · Stripe

Leadership Design leadership · Product strategy · Cross-functional leadership · Practice development · Team building · Mentoring · Digital transformation · Agile product delivery
